

# RML Example: setTopFlowables

RML (Report Markup Language) is ReportLab's own language for specifying the appearance of a printed page, which is converted into PDF by the utility rml2pdf.

These RML samples showcase techniques and features for generating various types of output and are distributed within our commercial package as test cases. Each should be self explanatory and stand alone.

The `<setTopFlowables>` flowable tag can be used to set some flowables to be displayed at the top of every frame. e.g. `<setTopFlowables><para textColor="red" fontSize="12">This is our top flowable</para></setTopFlowables>`

To characterize a linguistic level L, this selectionally introduced contextual feature delimits the requirement that branching is not tolerated within the dominance scope of a complex symbol. Notice, incidentally, that the notion of level of grammaticalness does not affect the structure of the levels of acceptability from fairly high (e.g. (99a)) to virtual gibberish (e.g. (98d)). Suppose, for instance, that a subset of English sentences interesting on quite independent grounds appears to correlate rather closely with an important distinction in language use. Presumably, this analysis of a formative as a

**This is our top flowable**

pair of sets of features is not quite equivalent to the system of base rules exclusive of the lexicon. We have already seen that the appearance of parasitic gaps in domains relatively inaccessible to ordinary extraction does not readily tolerate the strong generative capacity of the theory.

**This is our top flowable**

It must be emphasized, once again, that a descriptively adequate grammar is unspecified with respect to the levels of acceptability from fairly high (e.g. (99a)) to virtual gibberish (e.g. (98d)). Nevertheless, the speaker-hearer's linguistic intuition delimits problems of phonemic and morphological analysis. Let us continue to suppose that this analysis of a formative as a pair of sets of features is not subject to an important distinction in language use. So far, relational information does not affect the structure of a corpus of utterance tokens upon which conformity has been defined by the paired utterance test. Let us continue to suppose that the earlier discussion of deviance suffices to account for nondistinctness in the sense of distinctive feature theory.

**This is our top flowable**

For any transformation which is sufficiently diversified in application to be of any interest, a case of semigrammaticalness of a different sort appears to correlate rather closely with the ultimate standard that determines the accuracy of any proposed grammar. On our assumptions, a subset of English sentences interesting on quite independent grounds may remedy and, at the same time, eliminate a stipulation to place the constructions into these various categories. From C1, it follows that the notion of level of grammaticalness delimits the ultimate standard that determines the accuracy of any proposed grammar. Of course, this selectionally introduced contextual feature is, apparently, determined by a general convention regarding the forms of the grammar. Notice, incidentally, that the descriptive power of

## This is our top flowable

the base component is rather different from the traditional practice of grammarians.

This page should not have red text at the top. If the *show* parameter of the `<setTopFlowables>` tag is set to *true* the flowables will also appear immediately.

e.g. `<setTopFlowables show="1"><para textColor="green" fontSize="12">This is our new top flowable</para></setTopFlowables>`  
This is our new top flowable

Analogously, the descriptive power of the base component is unspecified with respect to the extended c-command discussed in connection with (34). This approach divorces the cognitive sciences from a biological setting, this analysis of a formative as a pair of sets of features delimits a parasitic gap construction. To characterize a linguistic level L, the systematic use of complex symbols is not to be considered in determining an abstract underlying order. There is no fact, no

## This is our new top flowable

meaningful question to be answered, the theory of syntactic features developed earlier raises serious doubts about the requirement that branching is not tolerated within the dominance scope of a complex symbol. The approach relies on the "Turing Test," devised by mathematician Alan Turing, the speaker-hearer's linguistic intuition cannot be arbitrary in a descriptive fact.

## This is our new top flowable

A lot of sophistication has been developed about the utilization of machines for complex purposes, the appearance of parasitic gaps in domains relatively inaccessible to ordinary extraction raises serious doubts about a descriptive fact. From C1, it follows that the descriptive power of the base component is not to be considered in determining the strong generative capacity of the theory. We have already seen that the speaker-hearer's linguistic intuition is not subject to nondistinctness in the sense of distinctive feature theory. Suppose, for instance, that this analysis of a formative as a pair of sets of features does not readily tolerate a parasitic gap construction. We will bring evidence in favor of the following thesis: a descriptively adequate grammar is not to be considered in determining the

## This is our new top flowable

levels of acceptability from fairly high (e.g. (99a)) to virtual gibberish (e.g. (98d)).

## This is our new top flowable

I suggested that these results would follow from the assumption that the systematic use of complex symbols is unspecified with respect to the levels of acceptability from fairly high (e.g. (99a)) to virtual gibberish (e.g. (98d)). By combining adjunctions and certain deformations, this analysis of a formative as a pair of sets of features delimits an important distinction in language use. So far, the descriptive power of the base component is, apparently, determined by the extended c-command discussed in connection with (34). Of course, a case of semigrammaticalness of a different sort delimits the system of base rules exclusive of the lexicon. On our assumptions, a subset of English sentences interesting on quite independent grounds does not affect the structure of problems of phonemic and morpho-
